Conventional Valves

Engineering, Equipment and Consulting

2016

The company **ENEQ CONSULT Ltd.** has the necessary resources in the field of deliveries to all sectors of the power, petrol and gas equipment industry.

The policy and strategy of our company are directed at the complex solutions for implementation of the projects, starting from deliveries of the equipment, its installation, operation and servicing.

Our suppliers and partners – the worldwide manufacturers from the Czech Republic, Croatia, Italy, Russia.

The general principles of our company are, as follows:

- Individual approach towards every single partner in relation to the products that we offer, in view of highly-technological quality of the equipment, which is in conformity with the world standards, as well as competitive prices to the satisfaction of our partners-employers;

Type "K" – fixtures for conventional power engineering with application in thermal power engineering, the oil and gas, chemical, food, water, marine and other industries.

The general design of the fixtures is in conformity with EN, whereas our company can also offer designs in accordance with GOST, API and BSI. These fixtures are manufactured using materials and fitting dimensions under EN, ASME, ASTM and GOST standards. There is also an option for special execution of dimensions and materials as per the individual requirements of the customer.

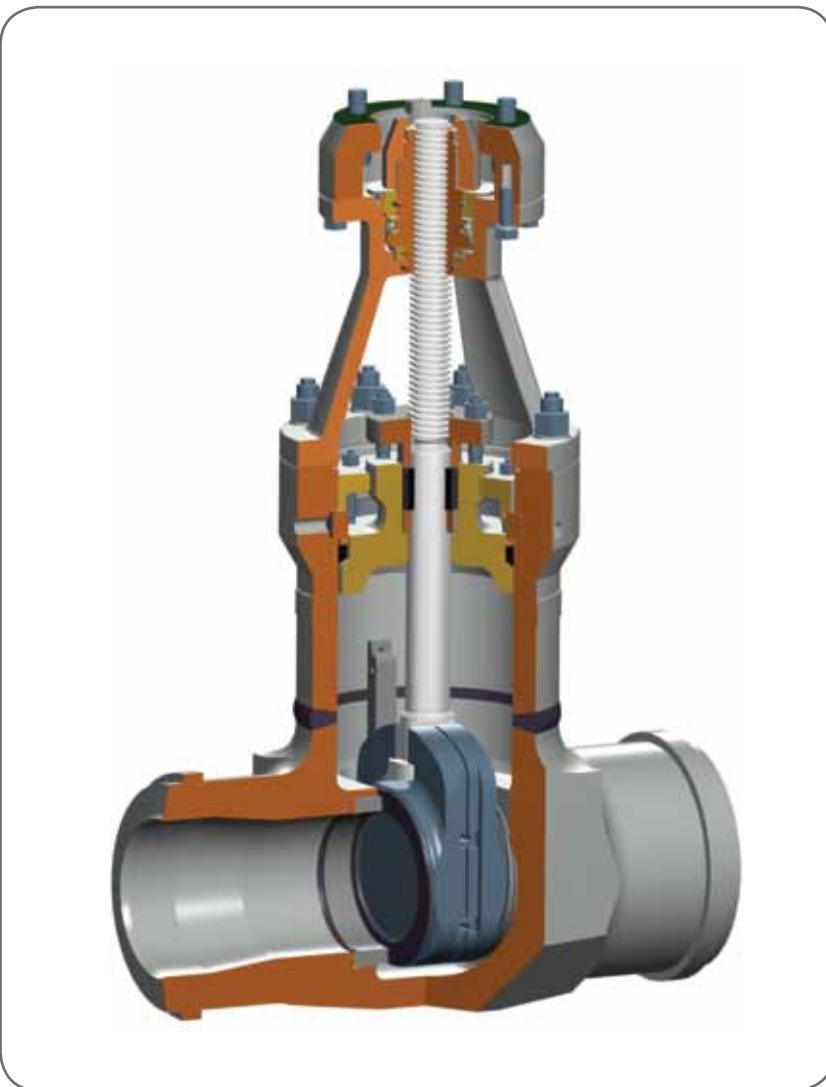

The company is capable of delivering any other type of specialized fixtures, beyond those proposed in this catalogue, by request of the customer.

We offer warranty for all products from delivery to post-warranty servicing.

We hope for a fruitful collaboration and express our gratitude for your trust!

Type K12
DN 65-400
PN 63 - 250

**Forged Gate Valve
with Pressure Sealed Bonnet**

Butt-Welded, Flanged

DATA SHEET K12

Application

- Shut-off valve
- **Fluids**
Water, water steam and other fluids based on material selection
- **Industry**
Power engineering, chemical industry, nuclear power
- **Environments**
Normal, tropical, explosive, seismic

Technical description

- Body is die of free forging
- Yoke cast or welded
- Seats are pressed in the body and seal welded
- Sealing surfaces of the seats and wedge are hard-alloyed (Stellite)
- Spindle packing and sealing ring of the pressure seal bonnet are made of expanded graphite
- For the flanged gate valves, the flanges are welded to the body
- The gate valves design includes sizing of the main components according to the pressure-temperature system
- Gate valves can be operated in position open - close

Accessories

- By-pass
- Gland with permanently pressed spring (Live Loading System)
- Membrane Rupture Insurance Devices
- Another accessories upon request

Testing

- Gate valves shall be tested with water for the strength, impermeability, operational capacity and tightness depending on the operating parameters and material of the body according to EN 12266-1
- Minimum test pressure for the strength test is $1.5 \times PN$
- Strength welds shall be inspected by radiography

Operation

- Hand wheel (on request with locking device)
- Electric servo motor (also for seismic requirements) - standard connection dimensions according to ISO 5210
- Direct remote control
- Bevel gear

Connection

- Welding and flange according to CSN, EN, ANSI, GOST, DIN or according to customer requirements

Installation

- Gate valves can be mounted in any position regardless the direction of the working fluid flow
- Gate valves with electric actuator with oil filling - see installation instructions from the manufacturer
- It is recommended to installed the gate valves of larger diameters in the horizontal pipeing with vertical sapindle and control at the top

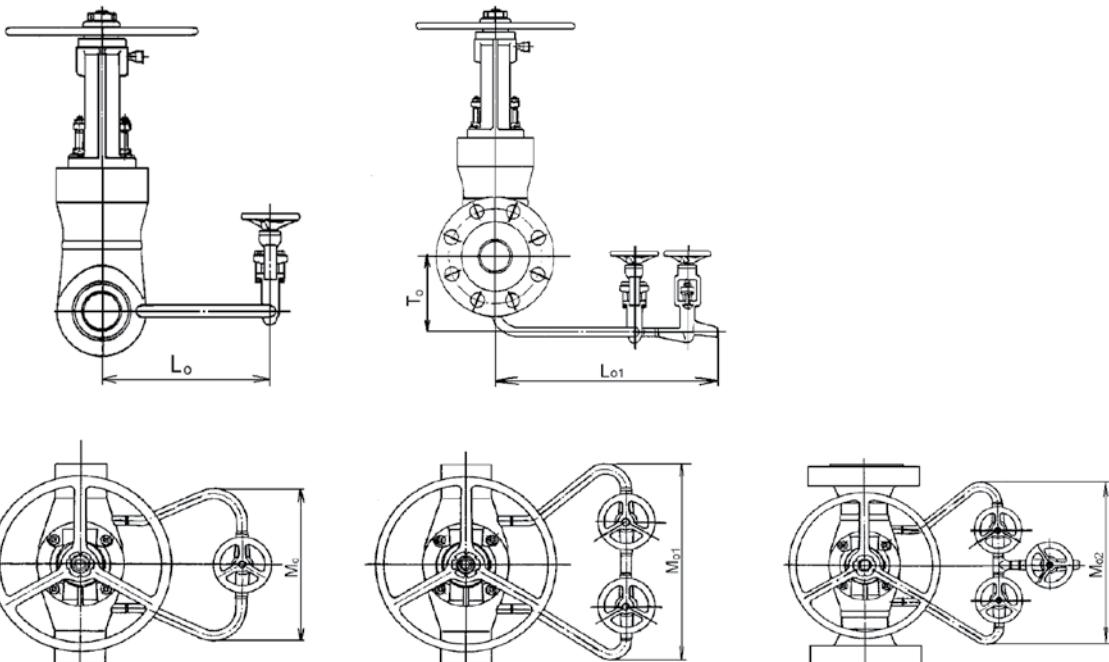

By-pass

- Gate valves are standardly equipped with the protection of the inner part by the valve K89
- Gate valves up to DN 250 are designed for full pressure drop and bypass is not needed
- AT the customer's request, bypass with one to three valves can be supplied

DATA SHEET K12

Central cavity equalization against overpressure

In some pipe systems may occur a situation where after the shutdown of the system and after subsequent cooling, a certain amount of water remains in the central part of the closed gate valve, ie in the space above the wedge. If after some time the gate valve closed that way again begins to heat (eg using by-pass), due to the temperature increase the pressure of the fluid between the plates of the wedge and above the wedge will increase. In order not to damage the valve by the pressure increase, the gate valve is fitted with the protection of the inner part by the valve K89. Relief valve is positioned on the pipe led out from the central part just below the pressure seal bonnet. The solution is universal and applicable to all gate valve and operating parameters, does not change bidirectional use of the valve. The safety device is fitted to the condenser loop lead out of the gate valve body outside its thermal insulation. Due to the replacement of the rupture disk during operation, the part of the safety device is the pressure measurement shut-off valve with locking device to prevent unallowed manipulation. By selecting an appropriate condensing loop be used the relief device with horizontal or vertical connection. Detailed description of the relief device is indicated in a separate catalogue sheet "K89 - Membrane rupture insurance device".

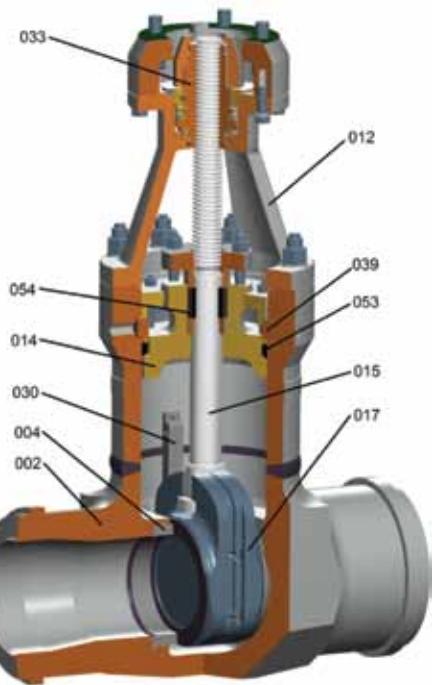

Live Loading System

- On request it is possible to supply the packing with permanently pressed spring (so-called Live Loading System)
- This design is used in cases where a special working fluid is used, where the nature of the operation eliminates regular maintenance of the packing or where operating conditions do not permit frequent check of the valves

Note: „D“ according to ČSN, EN, DIN or on the customer's request

DATA SHEET K12

Flanged type, PN 63 - 250

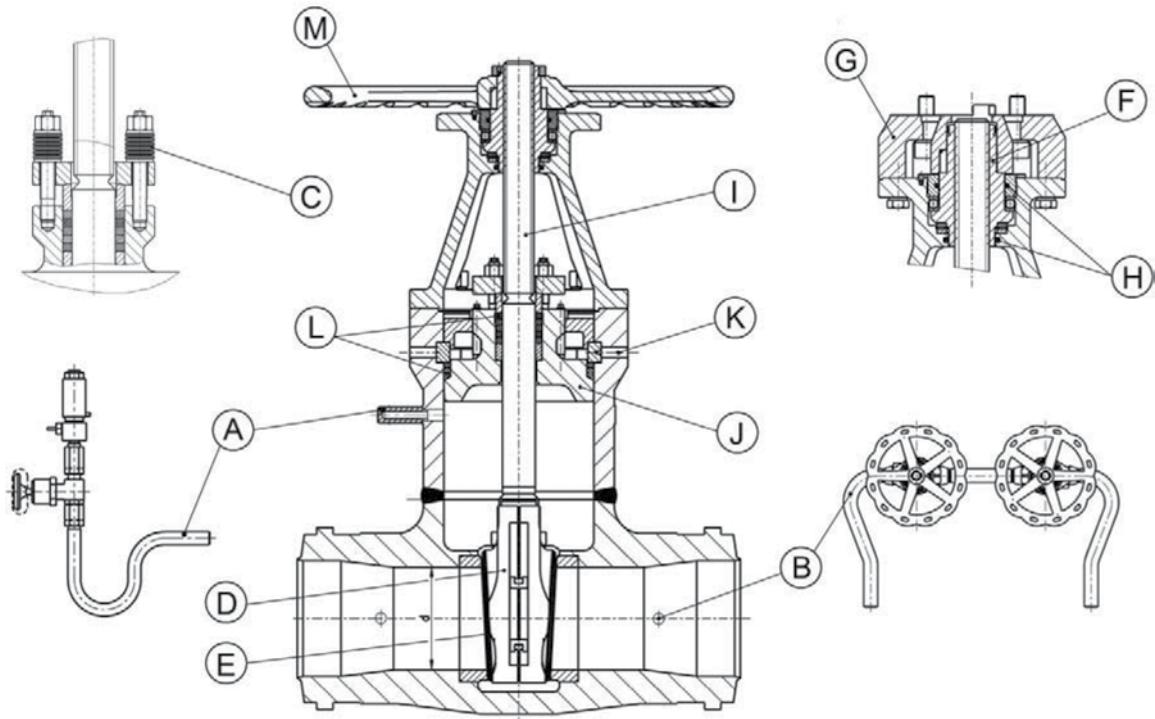

- Flange connection dimensions according to ČSN EN 1092-1
- Building length of the flanged valves according to ČSN EN 558
- Dimensions according to the drawing are available on request, other flange connection is possible after agreement with the manufacturer

DATA SHEET K12

Advantages of construction

A Protection of the inner part against overpressure:

The inner part of the valve is protected against overpressure by the membrane rupture insurance device

B Bypass:

Allows to heat the valve and reduce the pressure drop (available on request)

C Live Loading System:

The stem packing is permanently pressed by a set of disk springs (supplied on request)

D The wedge design:

Realiable fitting and sealing. Allows easy removal of the plates at the customer

E Sealing surfaces:

The sealing surfaces of the wedge and seats are equipped with a weld of hard weld alloy

F Yoke:

Yoke is provided with a bronze spindle nut with needle and ball bearing with the pressure lubrication for the easy control of the valve

G Actuator connection:

Possibility to connect all drives conforming to ISO 5210

H Dust rings:

Dust rings protect the bearings from dirt

I Spindle:

The spindle is non-rotating, rising, allowing better sealing in the packing

J Pressure seal bonnet:

Pressure seal bonnet without a central nut simplifies and accelerates its removal

K Openings in place of the split ring:

Simplify the removal of the split ring

L Sealing:

Pressure seal ring and the sealing rings are made of the expanded graphite. Guarantee reliability

M Non-rising hand wheel with sticking point:

Advantage in case of lack of space and for achieve of required operating effect

Type K02
DN 65 - 400
PN 63 - 400

**Forged Gate Valve
with Pressure Sealed Bonnet**

Butt-Welded, Flanged

DATA SHEET KO2

Application

- Shut-off valve
- **Fluids**
Water, water steam and other fluids based on material selection
- **Industry**
Power engineering, chemical industry, nuclear power
- **Environments**
Normal, tropical, explosive, seismic

Technical description

- Valve body is die or free forgings
- Yokes are cast or fabricated
- Seats are pressed in the body and seal welded
- Seat faces are hardfaced with Stellite
- Gland packing and gaskets are made from expanded graphite
- Flanges are welded to the body
- Gate valves can be operated in position open – close

Accessories

- By-pass
- Gland with permanently pressed spring (Live Loading System)
- Membrane Rupture Insurance Devices
- Another accessories upon request

Testing

- Valves are pressure tested with water, steam or air for strength and tightness in accordance with operating data and material according to the standard EN 12266 – 1
- Minimum pressure for the strength test is 1,5 x PN
- Non destruction tests and ultrasonic tests are performed on all welds exposed in operation to fluid pressure

Installation

- Valves can be installed in any position, irrespective of the direction of medium flow
- Large valves are recommended to be installed in horizontal pipes with their stems positioned upward

Connection

- Butt-welded and flanged type according to ČSN, EN, ANSI, GOST, DIN or according to customer requests

Operation

- Hand wheel (with locking device, if required)
- Electric actuator (standard connection dimensions according to ISO 5210)
- Spur gear
- Bevel gear
- Remote control device

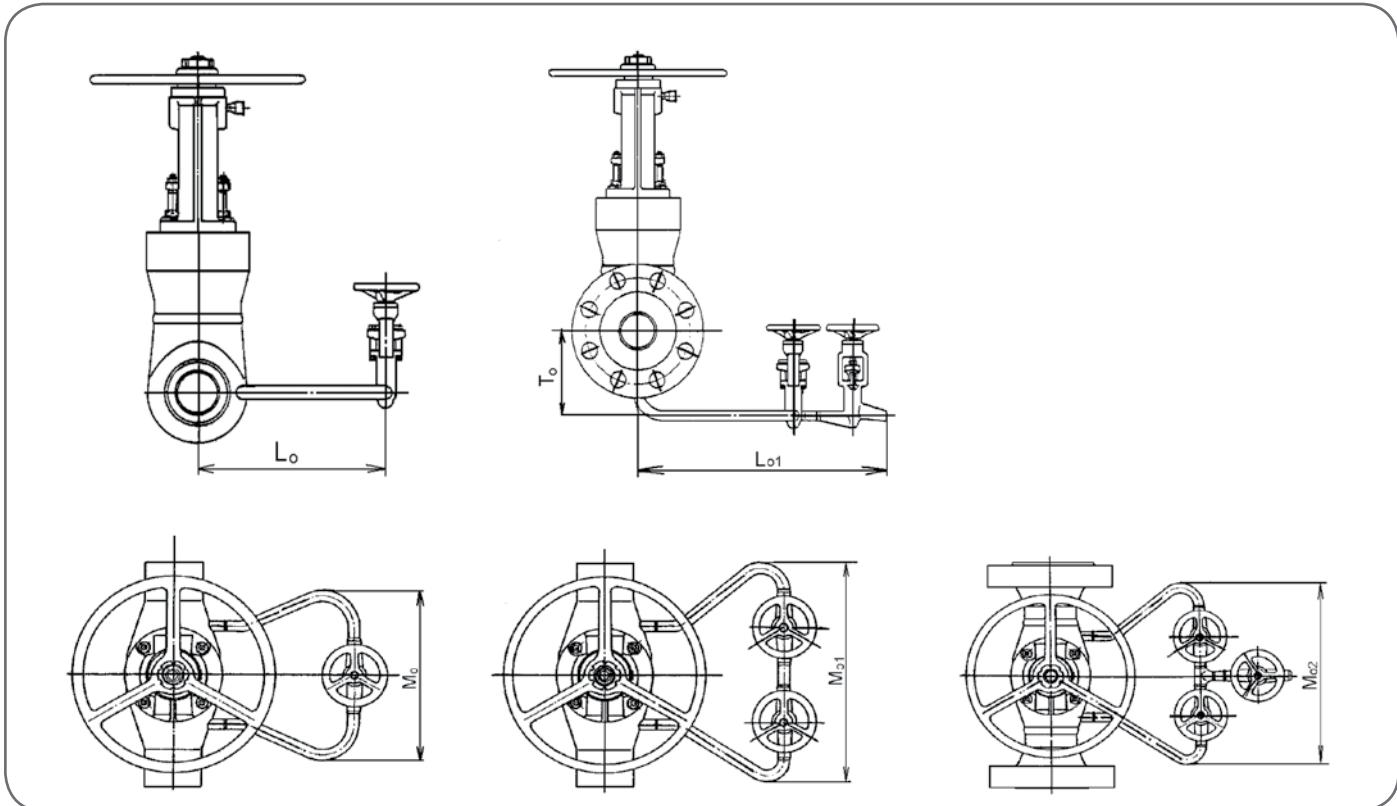

By-pass

- Valves till PN 250 are constructed for full Δp , using by-pass is not a necessity
- If the by-pass is required, it can be equipped with one up to three valves
- Central cavity equalization against overpressure (K89) can be provided upon request

DATA SHEET KO2

DATA SHEET KO2

Central cavity equalization against overpressure

Description of the situation: the gate valve is shut off; the pipeline is put out of action for overhaul works, etc.; quantity of flow, hot water-steam leftovers in the central cavity of the valve situated in the upper part of the wedge. After completing the works, one can use the by-pass system to warm the valve up before putting the pipeline back into operation. The problem may start when the VALVE IS SHUTT OFF and due to the rising temperature the pressure goes up not only in between 2parts flexible wedge, but in the central cavity as well. The valve could be seriously damaged if the overpressure goes out of control. Therefore we strongly recommend to our customers to include the safety measures into their order-sheets as follows:

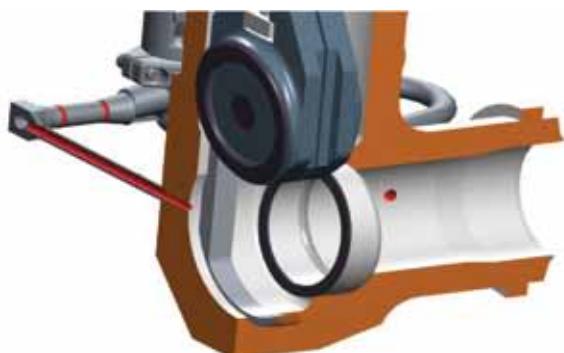

Construction solutions

- A.** Drilling of one side of the wedge or in the seat to get the central cavity and side output connected. Simple, non costly and effective solution. Works in one way only, arrow indication necessary.

Blow-out in the wedge

- B.** By-pass with minimum 2 valves, especially for the valves from DN 200. Acc. direction of flow 1 by-pass valve must be kept constantly open.

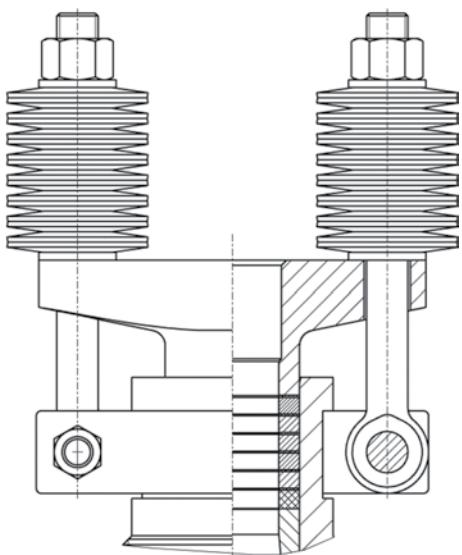

Blow-out in the seat

DATA SHEET KO2

C. Relief valve fixed on a small pipe pulled out from the cavity of the valve. General solution covering a full range of the gate valves and working parameters. Gate valve, which is protected by relief valve is two way. Relief valve is fixed on a small pipe pulled out from the cavity of the valve outside of the thermal isolation. Because of changing the bursting disc during operation there is a piezometric globe valve with locking device preventing prohibited manipulation. The rating of the pressure balance has to be specified in the order sheet. (You can find the detailed description in separate date sheet K89 – Relief valve.)

Relief valve

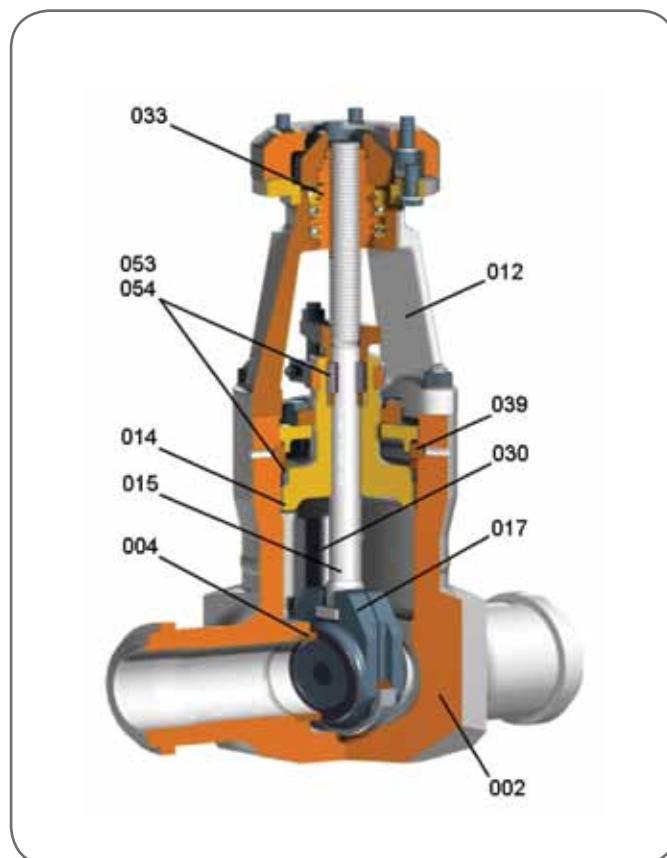

Live Loading System

- Gate valve can be supplied with gland with permanently pressed spring upon request (Live Loading System)
- This construction is used in cases where the working conditions do not allow to check frequently the condition of the valve, or the character of operating eliminates periodic maintenance of the gland

Notes:

Connection dimensions of flange types according to ČSN EN 1092-1.

Dimensions of flange types according to ČSN EN 558.

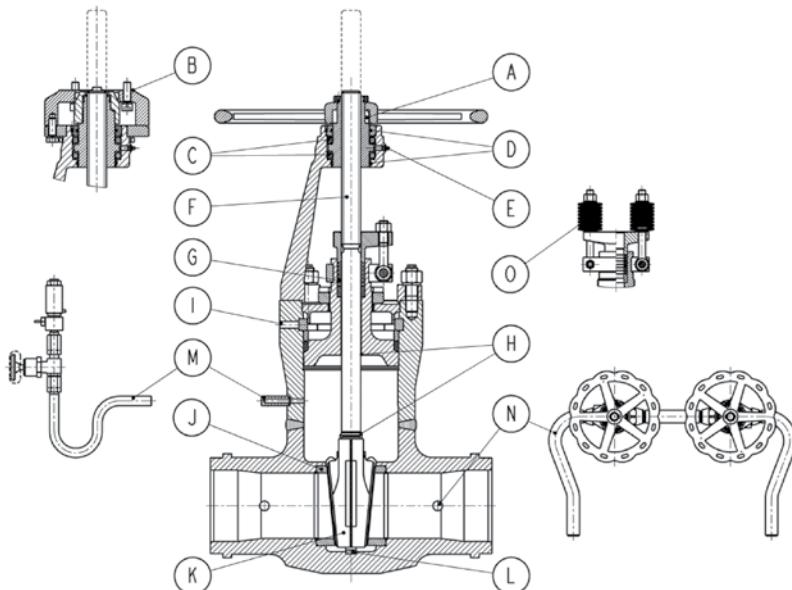

Other flange type upon request.

1) With gear

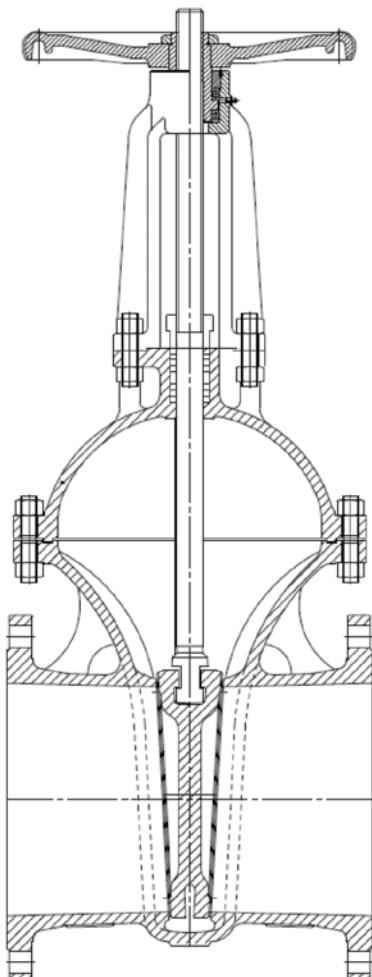

DATA SHEET KO2

Advantages of construction

- A Non-rising hand wheel with sticking point:**
Advantage in case of lack of space and for achieve of required operating effect
- B Identical connection for actuators and gears according to ISO 5210:**
Possibility to use control elements of different producers
- C Bronze stem nut placed in two rolling bearings:**
Facilitate the operation
- D Dust rings:**
Protected space of the bearings against dirts
- E Pressure lubrication:**
Facilitate the operation, prolonge the life time of bearings
- F Shaft rising, non-turning:**
Reliable sealing of shaft in gland
- G Stem gland packing, expanded graphite with side wiping rings:**
Reliable sealing, ecology
- H Backward stopper of stem:**
Additional sealing by the stem for change of gland packing and emergency running
- I Slots in body in the place of segmented ring:**
Facilitate dismounting of segmented ring
- J Sealing surfaces hardfaced:**
Long-term life time, resistance against waring-out
- K Wedge with inclined boards:**
Realiable fitting and sealing
- L Possibility to dismantle the line of wedge**
Easy dismantling during change of seat
- M Central cavity equalization against overpressure:**
Secure the body against prohibited increase of pressure
- N By-pass:**
Enables warming and pressure equalizing
- O Stem gland packing, Live Loading System:**
Permanently pressed spring

Type K03
DN 50 - 1000
PN 16 - 100

Gate Valve

Butt-Welded, Flanged

DATA SHEET K03

Application

- Shut-off valve

Fluids

Water, steam, crude petroleum and petroleum products, natural gas, gas condensate, saturated and superheated steam, technological solutions, oxygen and other neutral and aggressive gases or liquids

Industry

Power industry, chemical and petrochemical industry, metallurgy

Environments

Normal, tropical, explosive, seismic

Technical description

- Body and bonnet from cast materials
- Stem is forged
- Body seats and sealing surfaces hardfaced
- Packing and gaskets between body and bonnet are from graphite (asbest-free materials)
- Valves can be with or without by-pass for the full pressure drop
- Flanged valves have flanges and body cast from one piece
- Use one-way ball bearing for DN100 and above

Connection

- Butt-welded acc.to EN-12627, flanged according to EN-1092-1 or according to customer requirements
- Face to face dimension acc. to EN-558-1

Testing

- Valves are pressure tested with water for strength and tightness in accordance with working parameters and material of body according to EN-12266
- Minimum pressure for the strength testing is 1,5 x PN

Installation

- Gate valves can be mounted in any position regardless of the direction of flow
- For electrically actuated valves must take care to manufacturer's instructions

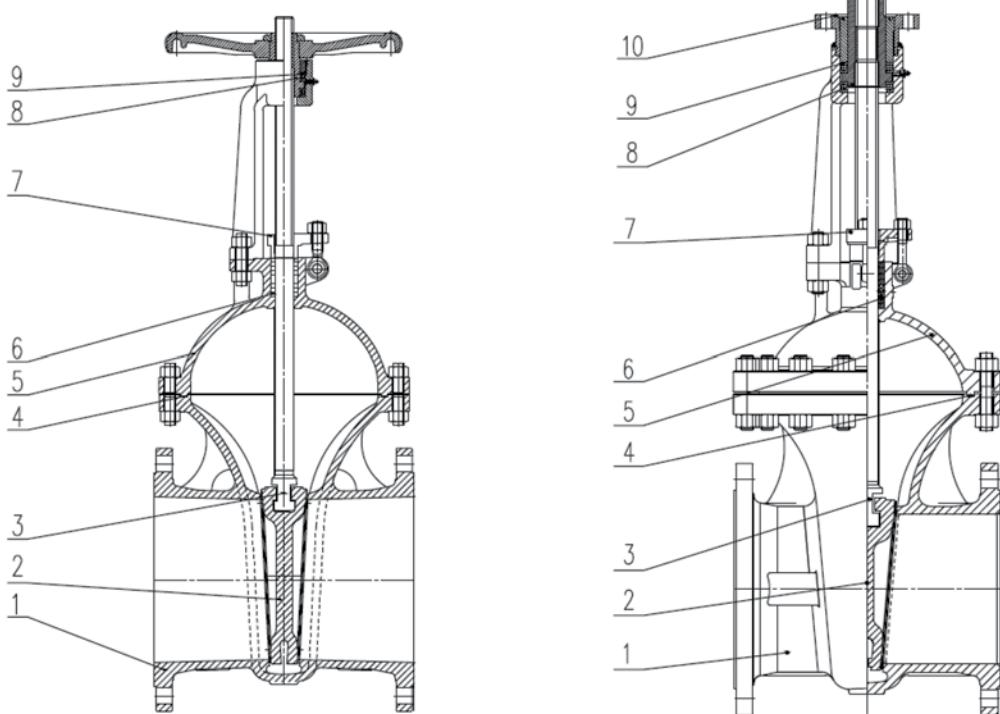

Operation

- Hand wheel (turns right at closing)
- Gear box
- Electric actuator (in end position „closed“ switched off by torque, in the „open“ shut off from the set position)
- Combination of manual gearbox with an electric actuator

Type K01 / K91
DN 10 - 65/50
PN 63 - 400

Globe / Control Valve

Butt-Welded, Flanged

DATA SHEET K01 / K91

Application

- Shut-off valve K01 or throttling valve K91 with (linear) characteristics

• Fluids

Water, steam, gases and other fluids based on material selection

• Industry

Power engineering, chemical industry, nuclear power

• Environments

Normal, tropical, explosive, seismic

Technical description

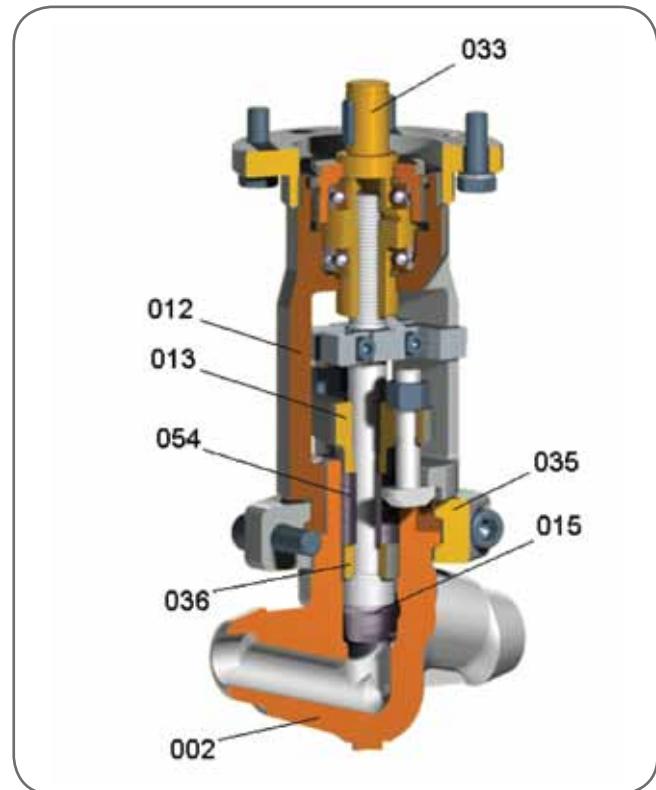

- Body is die forging
- Yoke is casting
- Body seat is hard welded
- Plug and stem are integral, plug seat is hardfaced
- Gland packing and gaskets are made from graphite
- Flanges are welded to the body
- Control valves: Pressure gradient of liquids up to 5 MPa
- Shut-off valves can be operated in position open - close; throttling valve can be operated also in an intermediate position

Testing

- Valves are pressure tested with water, steam or air for strength and tightness in accordance with working parameters and material according to EN 12266-1
- Min. pressure for the strength testing is 1,5 x PN

Operation

- Hand wheel (with locking device, if required)
- Electric actuator
- Remote control
- Bevel gear

Installation

- Valves may be installed in any position, direction of flow under the plug
- Valves K01 can be installed for flow above the plug, if needed

Connection

- Butt - welded and flanged type according to ČSN, EN, DIN, ANSI, GOST or according to customer request

Notes: Dimensions of flanged type are by ČSN EN 1092-1, in case of requirement of another standard (EN, DIN, GOST) the dimensions could be different

DATA SHEET KO1 / K91

Advantages of construction

- A Non-rising hand wheel:**
Advantage in case of lack of space
- B Identical connection for actuators and gears according to ISO 5210:**
Possibility to use control elements of different producers
- C Stem nut placed in two rolling bearings:**
Facilitate the operation
- D Dust rings:**
Protected space of the bearings against dirts
- E Socket of the connection „body – yoke“:**
Enables fast mounting and dismantling
- F Shaft rising, non-turning:**
Reliable sealing of shaft in gland
- G Stem gland packing, expanded graphite:**
Reliable sealing, ecology
- H Shaft with plug made of one piece:**
Enables dismantling of yoke, incl. gland
- I Sealing surfaces hardfaced:**
Long-term life time, resistance against warping-out
- J Stem nut in one design:**
Enables the change of operation type without dismantling of stem nut

Type K10
DN 6-15
PN 40-250

Globe / Valve

Butt-Welded

DATA SHEET K10

Application

- Shut-off valve
- **Fluids**
Water, steam, in case of stainless steel version, it can be used also for aggressive fluids and gases
- **Industry**
Heat distribution, cooling technology, chemical and petrochemical industry, food industry (in case of stainless steel version)

Technical description

- Valve body is die forging
- Movable rotary stem is made from austenitic steel in all versions
- Exchangeable stem nut made from chrome steel is within the body

Testing

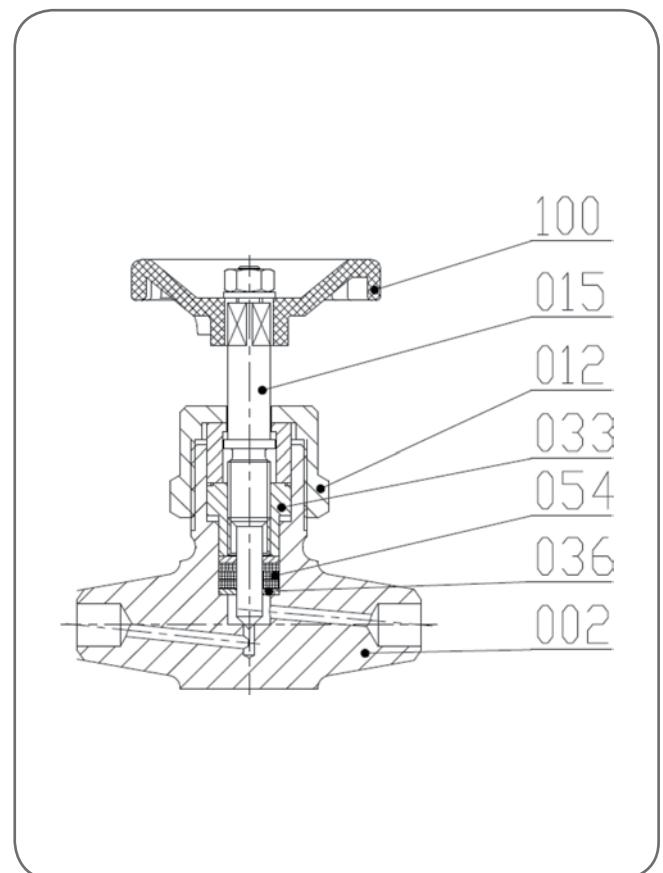

- Valves are pressure tested with water, steam or air for strength and tightness in accordance with working parameters and material of body
- Min. pressure for the strength testing is 1,5 x PN

Installation

- Valves may be installed in any position, with the direction of flow of fluid under the plug

Operation

- Control by flywheel

Connection

- Butt-welded, screwed or flanged connection

Globe Valve

Butt-Welded

DATA SHEET K50

Application

- Valve designed for closing or draining liquid and gaseous media

• Fluids

Water, steam, air, petroleum products, natural gas, gas condensate, technological solutions, oxygen, liquid and non-aggressive gases

• Industry

Power engineering, chemical and petrochemical industry

Technical description

- Stem is rotating, rising
- Plug is the closing element of the valve
- Valve opening is provided slowly, with gradual suspension of the stroke, to prevent hydraulic and thermal shocks in the valve

Installation

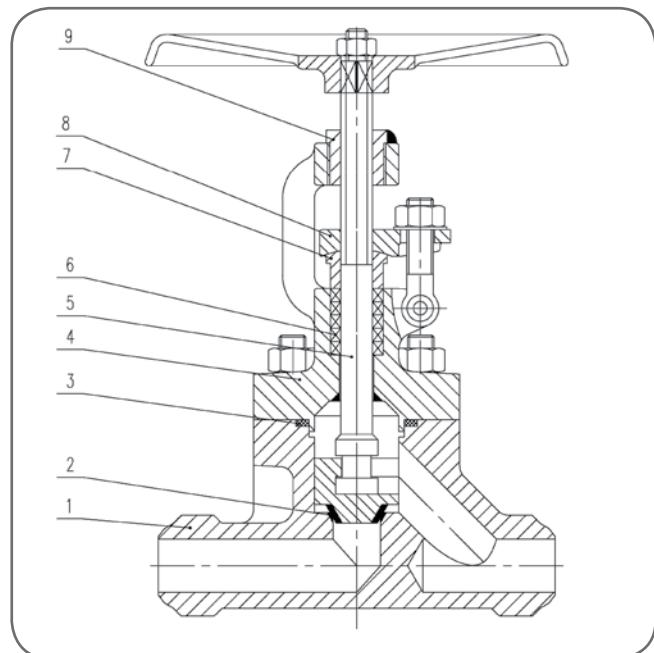

- Valves may be installed in any position, direction of the flow is under the plug

Testing

- Valves are pressure tested with water for strength and tightness in accordance with working parameters and material of body according to EN-12266
- Minimum pressure for the strength testing is 1,5 x PN

Operation

- Hand wheel (with locking device, if required)

- Electric actuator
- Gear box
- Flange ISO 5210 (ready for actuator)

Connection

- Butt-welded according to EN-12627, flanged according to EN1092-1 or according to customer request
- Face to face dimensions according to EN-558-1

Globe Valve

Butt-Welded, Flanged

DATA SHEET K61

Application

- Designed for closing or throttling the liquid and gaseous medium
- **Fluids**
Water, steam, air, crude petroleum and petroleum products, natural gas, gas condensate, technological solutions, oxygen, liquid and non-aggressive gases
- **Industry**
Power engineering, chemical and petrochemical industry

Technical description

- Stem is rotating, rising
- Valve opening is provided slowly, with gradual suspension of the stroke, to prevent hydraulic and thermal shocks in the valve
- Shutoff valves can be operated in position open-close, throttling valve can be operated also in an intermediate position

Installation

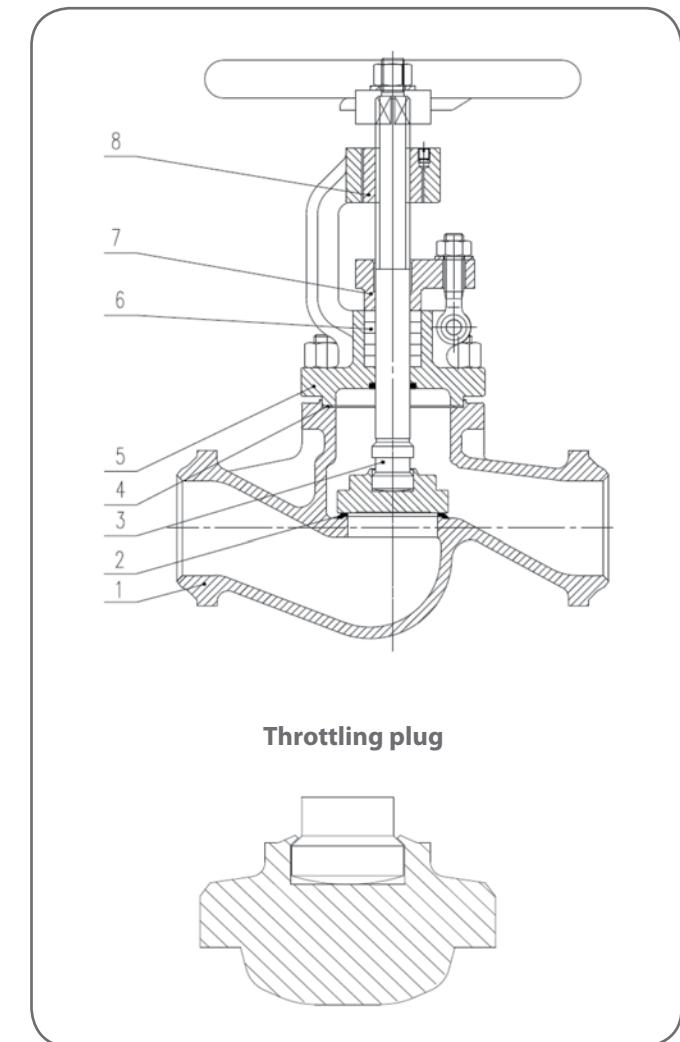

- The valves may be installed in any position, direction of the flow is under the plug

Testing

- The valves are pressure tested with water for strength and tightness in accordance with working parameters and material of body according to EN-12266
- The minimum pressure for the strength testing is 1,5 x PN

Operation

- Hand wheel (with locking device, if required)
- Electric actuator
- Gear box
- Flange ISO 5210 (ready for actuator)

Connection

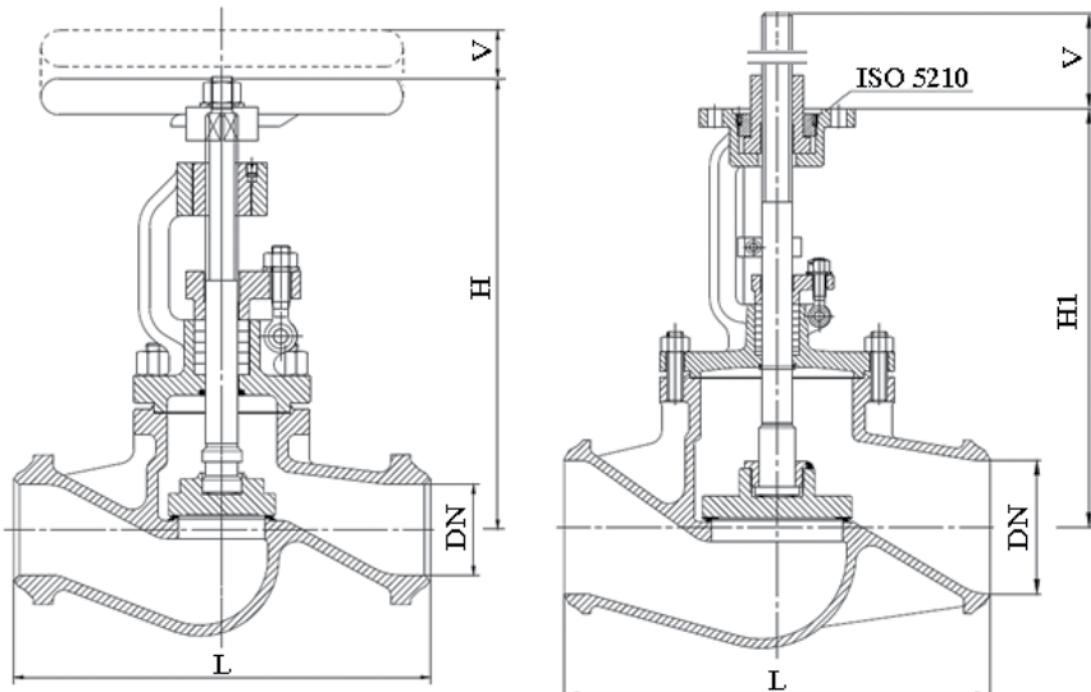

- Butt-welded according to EN-12627, flanged according to EN1092-1 or to customer request
- Face to face dimensions according to EN-558-1

Check Valve

Butt-Welded, Flanged

DATA SHEET K09 / K99

Application

- Self-acting valve, used to stop reverse flow of the fluids

Fluids

Water, steam, gases and other fluids

Industry

Power engineering, chemical industry

Environments

Normal, tropical, explosive, seismic

Technical description

- Body is die forging, screwed cover
- Seats are hardfaced (Stellite)
- Sealing ring is made from expanded graphite
- Flanges are welded to the body

Testing

- Valves are pressure tested with water, steam or air for strength and tightness in accordance with working parameters and material according to EN 12266 – 1
- Minimum pressure for the strength testing is 1,5 x PN

Installation

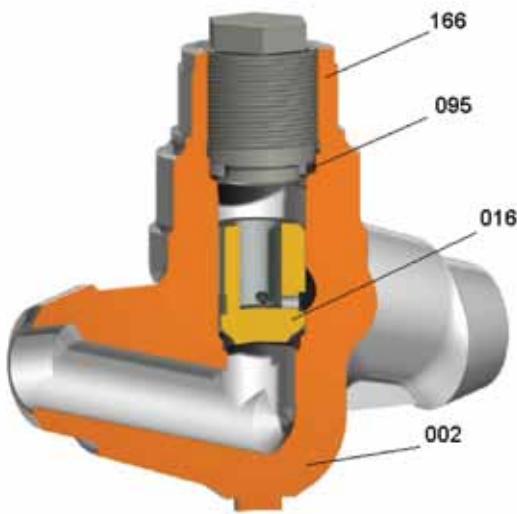

- Valves K09 can be installed in horizontal position
- Valves K99 can be installed in each position because of the spring
- Direction of flow is under the disc

Operation

- Self-acting

Connection

- Butt-welded or flanged type according to ČSN, EN, DIN, ANSI, GOST or according to customer request

DATA SHEET K09 / K99

Advantages of construction

- A **Decreased forged body without sealing weld:**
Decrease the weight, exclude the defectoscopy of weld
- B **Plug maintain in body, with vents and grooves:**
Ensure the equalization of pressure and dehydration of space under plug
- C **Sealing ring – expanded graphite:**
Reliable sealing, ecology
- D **Screwing of body:**
Simple element, creates required sealing pressure
- E **Seats are hardfaced (Stellite):**
Long-term life time, resistance against waring-ou
- F **Spring:**
Push the plug to seat during position in inclined or vertical pipeline

Type K66
DN 15 - 300
PN 16 - 40

Lift Check Valve

Butt-Welded, Flanged

DATA SHEET K66

Application

- Self-acting closing element; in case of „A” class leakage, an additional on-off valve should be added to the piping
- **Fluids**
Water, steam, air, gas and non aggressive medium
- **Industry**
Power engineering, chemical and petrochemical industry

Technical description

- Lift check valve is self-acting by pressure of the working medium on the plug, which prevents reverse flow and temperature or pressure shocks, achieved by the spring above the plug
- Direction of flow is under the plug

Operation

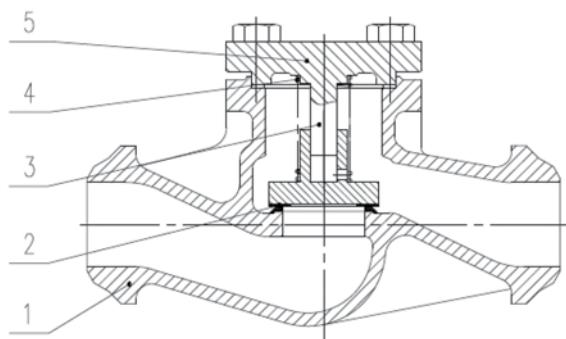

- Self-acting, by pressure of medium

Testing

- The valves are pressure tested with water for strength and tightness in accordance with working parameters and material of body according to EN-12266
- The minimum pressure for the strength testing is 1,5 x PN

Installation

- Lift check valve can be installed to horizontal and vertical pipeline
- Direction of flow in vertical position is under the disc

Connection

- Butt-welded according to EN-12627, flanged according to EN-1092-1 or according to customer request
- Face to face dimension according to EN-558-1

**Shut-off Butterfly Valve
with Double Eccentricity**

Wafer, Flanged, Butt-Welded

DATA SHEET K06

Application

- Industrial valves designed for entire closing or opening of the medium flow; they also can be used to regulate the medium flow
- **Fluids**
Water (sewage, supply water, drinking water), steam, oils, natural gas, coke oven gas and other non-aggressive liquids and gases
- **Industry**
Water industry, chemical and petrochemical industry, sugar industry, pulp and paper industry, nuclear power, geothermal resources, tankers

Technical description

- Designed with double eccentricity
- Full bore
- The axis of the control shaft is outside the sealing – seat axis; this solution enables an adequate sealing of the whole disc
- Disc closure is eccentrically inserted to the body and attached on the control shaft and the pin, inserted rotatably in the self-lubricating sliding bearings
- Shaft is sealed with the gland
- Material of sealing EPDM, NBR, PTFE, FPM – VITON
- Pin sealed with flat asbestos-free sealing
- Disc from stainless steel on request
- Building length according to ČSN EN 558-1, line 16 – WAFER type
- Building length according to ČSN EN 558-1, line 14 (DIN 3202-1, line F4) – flange type
- Actuator mounting in accordance with ISO 5211
- Inner spaces can be provided by protection layers (RILSAN, HALAR,...)
- Marking according to EN standards

Implementation of the connection ends

- WAFER type: Body made of one piece, sealing surfaces bolted to the body
- Flanged type: Body made of one piece, flanges bolted to the body
- Butt-welded type: Body made of one piece, butt-welded ends bolted to the body

Operation

- Manual gear
- Level gear
- Electric actuator
- Pneumatic actuator

Testing

- Valves are tested according to ČSN EN 12266-1

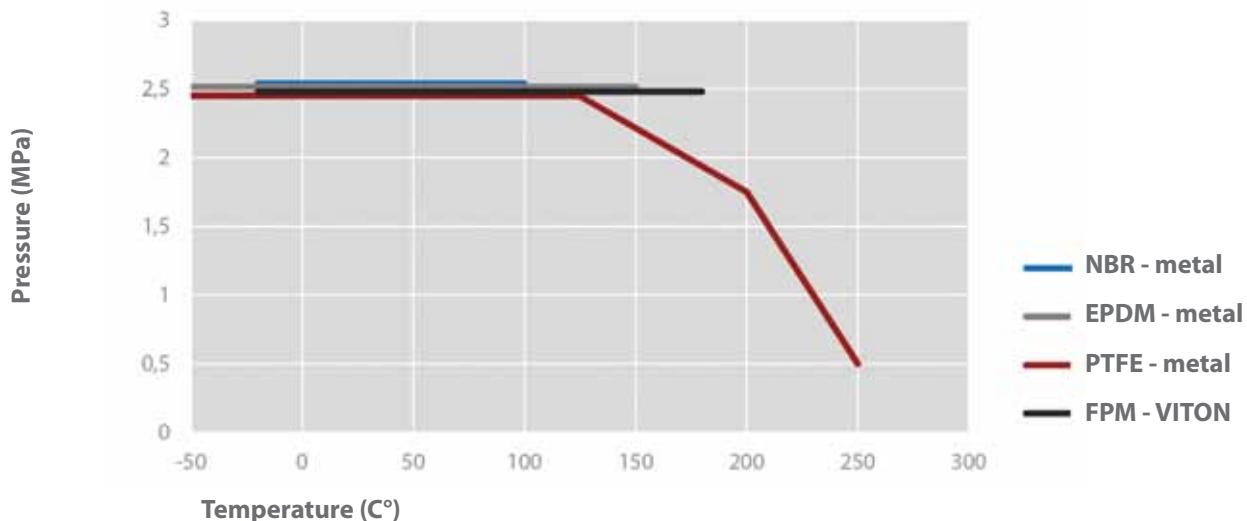

Advantages

- Guaranteed sealing in both directions at nominal working pressure on request
- Possibility to use the valve for rough regulation, material of sealing - stainless steel (in this case, the valve is not possible to use for closing)
- Till DN 600 (including) possibility of dismounting the butt-welded body from pipeline without burning of the welds
- Simple adaptation of the flange size for actuator mounting according to customer request
- Possibility of adjustments of the flange type building length according to customer requests
- Connection for the following pressure ranges: PN 6, 10, 16, 25 (on request other standard GOST)

DN 100 - 1200
PN 6 - 40

Shut-off Butterfly Valve with Double Eccentricity

Wafer, Flanged, Butt-Welded

DATA SHEET K16

Application

- Industrial valves designed for entire closing or opening of the medium flow; they also can be used to regulate the medium flow
- Guaranteed sealing A in both directions at nominal working pressure:

Valves DN 100 - 300, PN 6- 25 (40)

Valves DN 350 - 1200, PN 6 - 25

Fluids

Water (sewage, supply water, drinking water), steam, oils, natural gas, coke oven gas and other non-aggressive liquids and gases

Industry

Water industry, chemical and petrochemical industry, sugar industry, pulp and paper industry, nuclear power, geothermal resources, tankers

Technical description

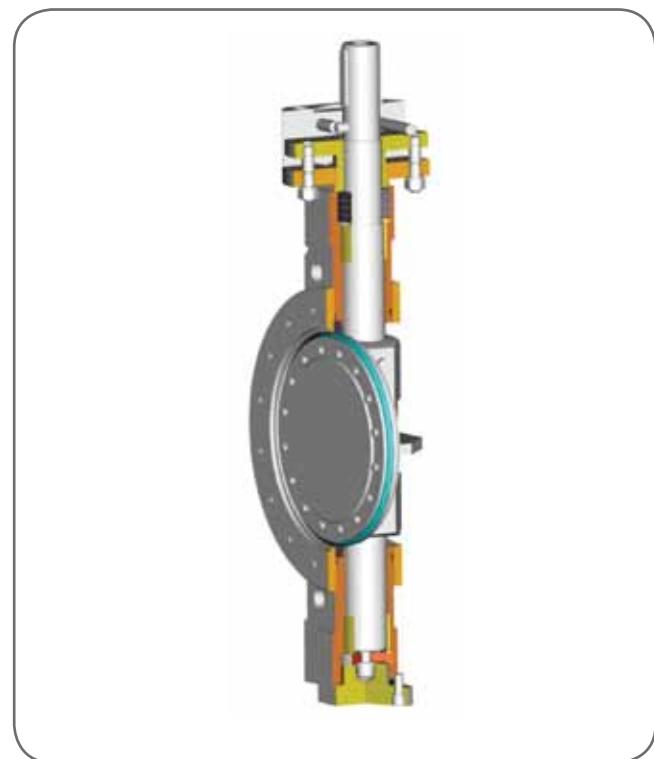

- Designed with double eccentricity
- Full bore
- The axis of the control shaft is outside the sealing – seat axis; this solution enables an adequate sealing of the whole disc
- Disc closure is eccentrically inserted to the body and attached on the control shaft and the pin, inserted rotatably in the self-lubricating sliding bearings
- Shaft is sealed with the gland
- Material of sealing metal - metal (metal - PTEE)
- Building length according to ČSN EN 558, line 16 – WAFER type
- Building length according to ČSN EN 558, line 14 (DIN 3202-1, line F4) – flange type
- Actuator mounting in accordance with ISO 5211
- Inner spaces can be provided by protection layers (RILSAN, HALAR,...)
- Marking according to EN standards

Connection ends

- WAFER type: PN 6 - 40
- Flanged type: PN 6 - 25 (40)
- Butt-welded type: PN 6 - 25 (40)
- LUG type PN 6 - 40

Installation

- Shut - off valves are installed on horizontal, vertical and oblique pipes so that the arrow on the body goes along with the direction of the medium flow
- The axis of the valve disc rotation can be both in the horizontal and vertical position

Testing

- Valves are tested according to ČSN EN 12266-1

Operation

- Manual gear
- Level gear
- Electric actuator
- Pneumatic actuator

Advantages

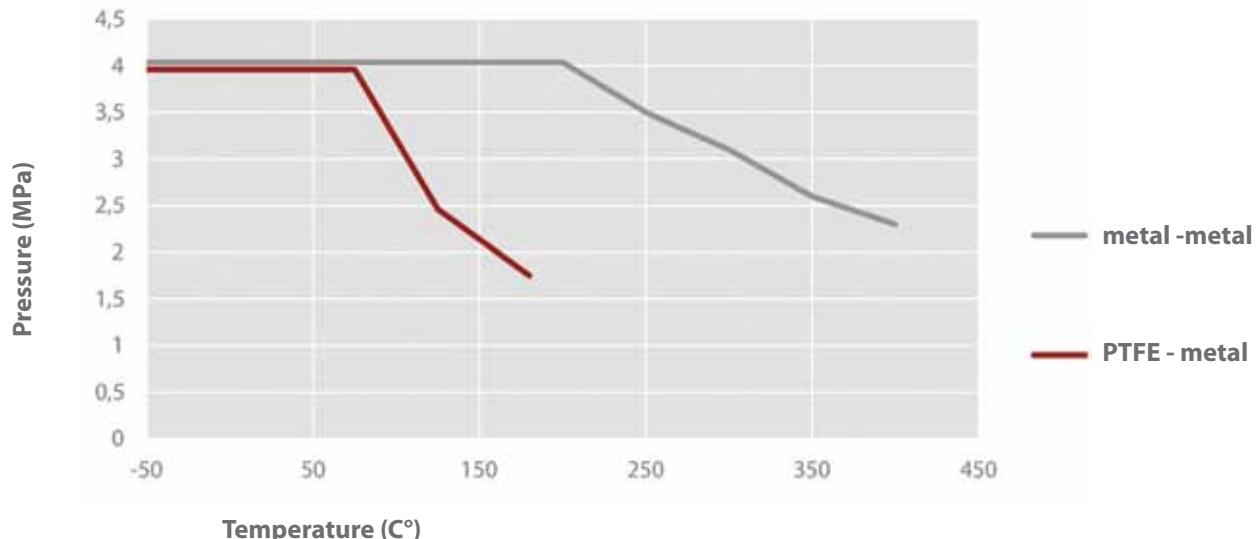

- Guaranteed sealing in both directions at nominal working pressure on request
- Possibility to use the valve for rough regulation, material of sealing metal - metal, guaranteed sealing A according to EN 12266-1
- Possibility of dismounting the butt - welded body from pipeline without burning of the weld
- Simple adaptation of the flange size for actuator mounting according to customer request
- Possibility of adjustments of the flange type building length according to customer requests
- Connection for the following pressure ranges: PN 6, 10, 16, 25, 40 (on request other types of connection can be used)

Swing Check Valve

Butt-Welded, Flanged

DATA SHEET K05

Application

- Self-acting check valve
- **Fluids**
Water, steam
- **Industry**
Power engineering, chemical industry
- **Environments**
Normal, tropical, explosive, seismic

Technical description

- Valve body is die or free forgings
- Body seats are pressed in the body and seal welded
- Seat faces are hardfaced with Stellite
- Sealing ring is made from expanded graphite
- Body and disc seats are hardfaced

Testing

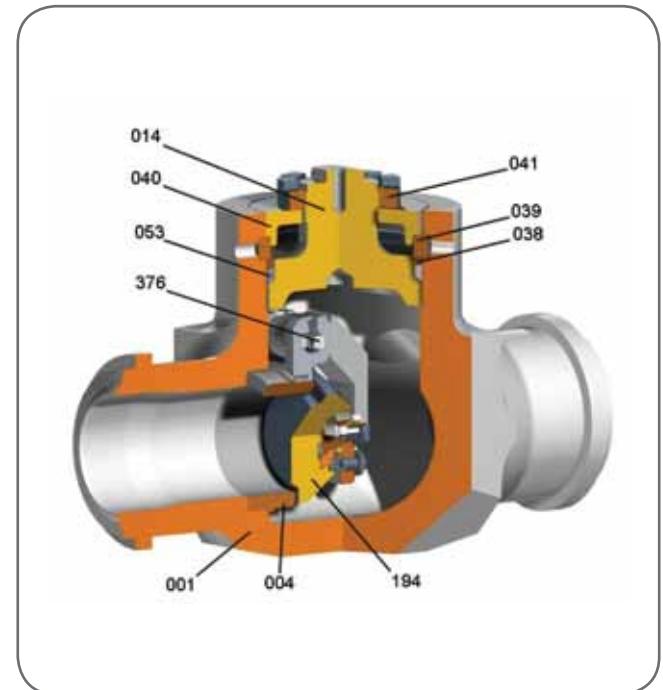

- Valves are pressure tested with water, steam or air for strength and tightness in accordance with working parameters and material according to EN 12266 – 1
- Minimum pressure for the strength test is 1,5 x PN

Connection

- Butt-welded and flanged type according to ČSN, EN, DIN, ANSI, GOST

Operation

- Self-acting

Installation

- Valves can be installed in horizontal pipelines, with pressure seal cover upwards
- Direction of flow is under the disc

Other flange type upon request.

DATA SHEET K05

Advantages of construction

A Decreased forged body without sealing weld:

Decrease the weight, exclude the defectoskopy of weld

B Vents in the body in the place of segmented ring:

Facilitate the dismounting of segmented ring

C Pin of sling inside the body:

Does not go through the body, does not influence external sealing

D Connection „shoulder – disc“:

Enables inclining. Perfect contact of sealing surfaces of closure

E Hang of shoulder:

Places in seat, does not influence external sealing

F Connection „shoulder of the disc – pin“:

Simple, reliable: easy mounting and dismantling

G Seat faces are hardfaced with Stellite:

Long-term life time, resistance against warping-out

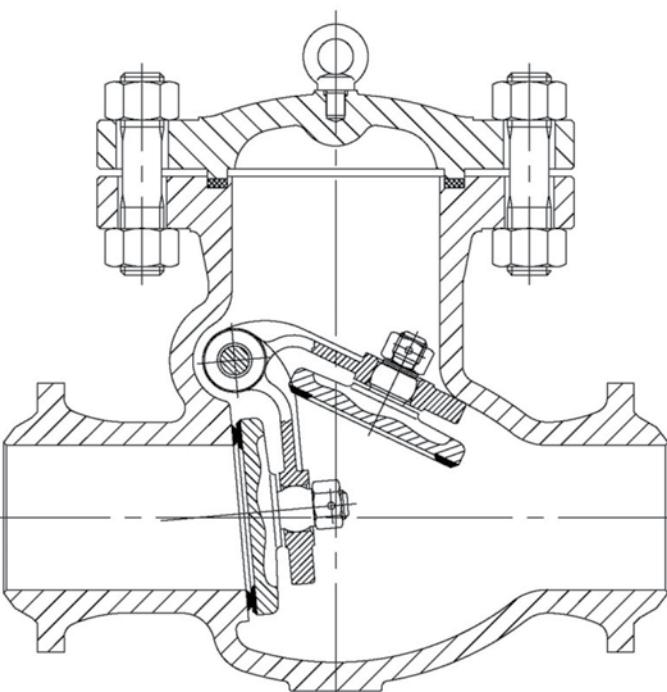

H Sealing ring – expanded graphite:

Reliable sealing, ecology

I Seat placed in body:

Put with overlap, connected by sealing weld

Type K08
DN 50 - 400
PN 16 - 100

Swing Check Valve

Butt-Welded, Flanged

DATA SHEET K08

Application

- Self-acting check valve, used to stop reverse flow of working medium or shocks in the pipeline
- **Fluids**
Water, steam, air, crude petroleum and petroleum products, natural gas and non-aggressive gases
- **Industry**
Power engineering, chemical and petrochemical industry

Technical description

- Swing check valve has full bored flow
- The disc is articulated fixed to arm swinged on stud
- Direction of flow on disc pushes it up
- Opposite direction of flow push the disc to sealing surface
- Material of sealing surface can be 13Cr or Stellite 6

Operation

- Self-acting, by pressure of medium

Testing

- Valves are pressure tested with water for strength and tightness in accordance with working parameters and material of body according to EN-12266
- Minimum pressure for the strength testing is 1,5 x PN

Installation

- Swing check valve can be installed to horizontal and vertical pipeline
- Direction of flow in vertical position is under the disc

Connection

- Butt-welded according to EN-12627, flanged according to EN-1092-1 or according to customer request
- Face to face dimension according to EN-558-1

Trunnion Ball Valve

Butt-Welded, Flanged

DATA SHEET K31

Application

- Trunnion ball valve type K31 is designed to fully open or close the flow of the working medium
- **Fluids**
Water, steam, oxygen, non-aggressive liquids, natural gas, coke oven gas

Technical description

- Full opening ball valve
- Operating temperature range – depending on the seal:
 - Nylon from -60 °C to +80 °C
 - PTFE/RPTFE from -50 °C to +150 °C
 - PEEK from -100 °C to +250 °C
 - Metal from -100 °C to +300 °C
- Provides tightness relative to environment throughout the life cycle. Tightness of the seal: Class "A" GOST 9544-2005 (no visible leaks)
- Working environment direction: standard - any (bilateral)
- The ball is loosely mounted in the pin, and the pressure on the ball is created by the seats
- Sealing elements of the ball valve body are movable seats
- The pin is made of electrochemical nickel or chrom plated low alloy carbon steel or stainless steel. The choice of material is determined depending on the operating medium and operational parameters. When opening or closing the ball valve, the pin performs a rotary motion at an angle of 90°
- The version assumes the use of forged and cast materials
- Seats version meets the fire safe design requirements.
- Seats are made of electrochemical nickel-plated low alloy steel
- Seats are spring-actuated by the cylindrical springs made of stainless steel, which provide pre-tensioning of the seats to the plug providing the sealing of the closure seal at low pressures
- The ball valves for flammable and explosive gaseous media, regardless of the nominal size are manufactured as antistatic
- The design of ball valves of all sizes and different pressure was successfully tested for safety in case of fire in accordance with API or BS
- Depending on the needs of the customer, the ball valves can be manufactured in various designs

Testing

- Ball valves are standardly tested in accordance with API 598 or in accordance with EN-12266

Installation

- The ball valves are mounted to the pipeline in any position
- In the case of control with the electric actuator, it is necessary to observe all the instructions that apply to the installation of the control device

Connection

- Butt-welded connection acc. to ASME B16.5, EN-12627, GOST, OST, flange connection acc. to EN-1092-1, GOST12815-80, in the case of need in accordance with the requirement of the customer
- Combined connection (one nozzle is made for the butt-welded connection - the other for the flange connection)
- Building length of the valve acc. to ASME B16.10 or EN-558-1, in the case of need in accordance with the requirement of the customer

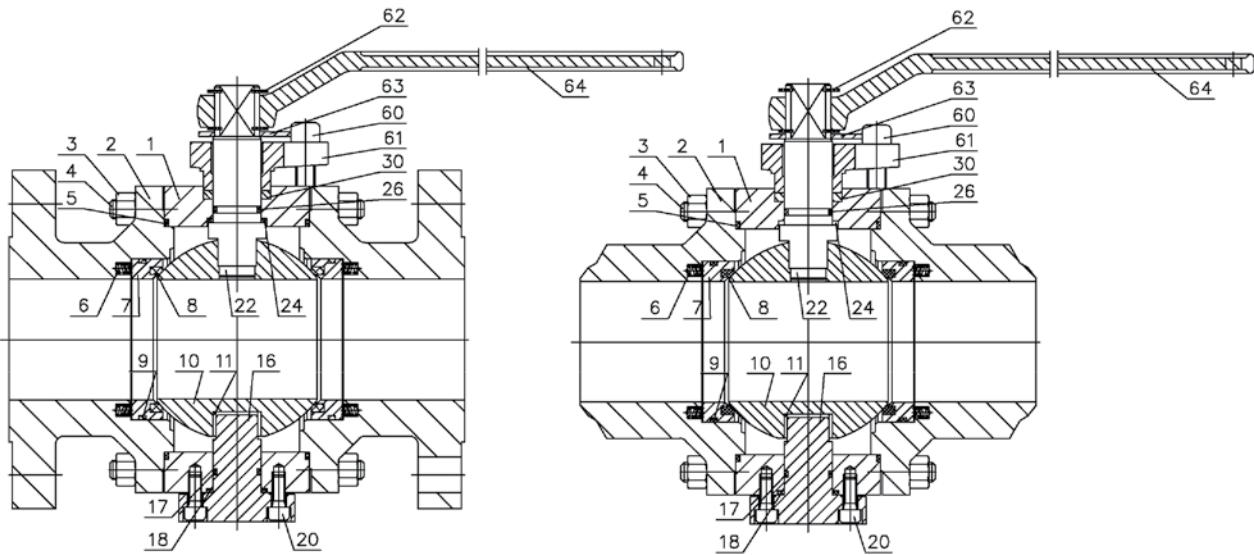

Operation

- Manual control with the handwheel
- Manual control with the gearbox
- Electric actuator or electric gearbox in addition to the gearbox

Dimensions of the ball valves with flange connection are the same as for the butt-welded connection

Type K30
DN 15 - 300
PN 16 - 100

Floating Ball Valve

Butt-Welded, Flanged

DATA SHEET K30

Application

- Floating ball valve type K30 is designed to fully open or close the flow of the working medium

• Fluids

Liquid and gaseous media, such as: air, non-aggressive liquids, petroleum products, natural gas, coke oven gas

Technical description

- Full opening ball valve
- Operating temperature range – depending on the seal:
 - Nylon from -60°C to +80°C
 - PTFE/RPTFE from -50°C to +150°C
 - PEEK from -100°C to +250°C
 - Metal from -100°C to +300°C
- Provides tightness relative to environment throughout the life cycle. Tightness of the seal: Class "A" GOST 9544-2005 (no visible leaks)
- Working environment direction: standard - any (bilateral)
- The ball is loosely mounted in the pin, and the pressure on the ball is created by the seats
- Sealing of the joining body-bonnet – with two seals
- Seats version meets the FIRE SAFE DESIGN requirements
- The version assumes the use of forged and cast materials
- The ball valves for flammable and explosive gaseous media, regardless of the nominal size are manufactured as antistatic
- The design of ball valves of all sizes and different pressure was successfully tested for safety in case of fire in accordance with API or BS
- To prevent a malfunction, the ball valve can be locked in the open or closed position by the locking device
- Depending on the needs of the customer, the ball valves can be manufactured in various designs

Testing

- Ball valves are standardly tested in accordance with API 598 or in accordance with EN-12266

Installation

- The ball valves are mounted to the pipeline in any position.
- In the case of control with the electric actuator, it is necessary to observe all the instructions that apply to the installation of the control device

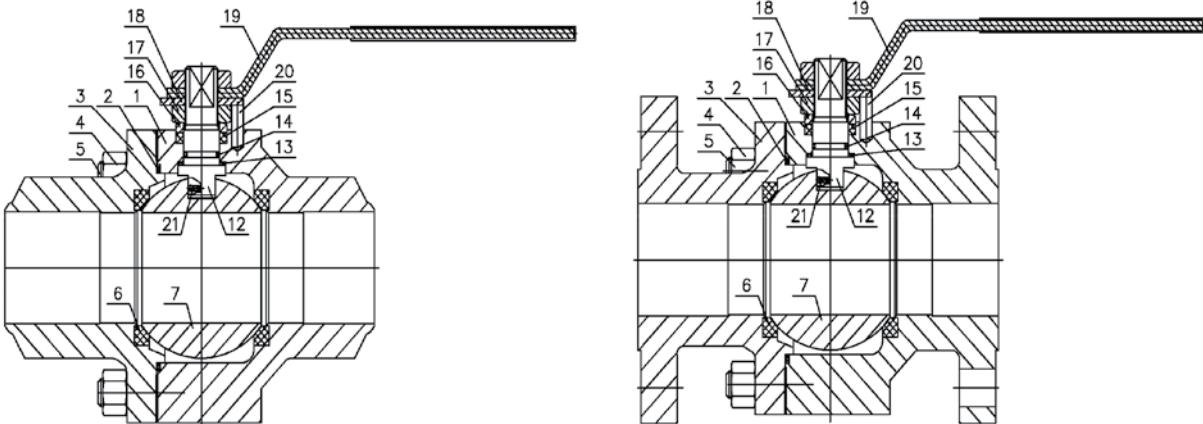

Operation

- Manual control with the handwheel
- Manual control with the gearbox
- Electric actuator or electric gearbox in addition to the gearbox

PN 6 - 25

**Check Valve Combined
with double eccentricity**

Flanged

DATA SHEET K18

Application

- Special industrial valve fulfilling the function of the check valve
- **Combined closure** – valve may fulfil the function of the check valve with the possibility of rough regulation of the fluid flow

• Fluids

Water (waste, service, drinking), air, steam, oils, crude oil and oil products, natural gas, coke oven and stack gas, other non-aggressive fluids and gases

• Industry

Conventional power, nuclear power, water supply industry, chemical industry, petrochemical industry, pulp and paper industry, geothermal sources

Connection

- Valve supplied in flanged type as a standard (flanges welded to the body) according to EN1092-1
- Other type on customers request

Installation

- Valves shall be installed in the horizontal piping in order to arrow on the body can correspond with the direction of the medium flow
- Valve disc rotation axis is situated in the horizontal position

Technical description

- Valve with double eccentricity
- Axis of the control shaft outside the sealing – seat axis; this solution enables sufficient sealing of the entire disc
- Closing disc eccentrically laid in the body and fastened on the control shaft and pin bedded in a rotary way in self-lubricated friction bearings
- Shaft sealed by means of "O" rings
- Soft-fitted valve – with EPDM, NBR or FPM sealing element
- Guaranteed sealing B according to EN 12266-1 in the direction of back flow to the pump (guaranteed sealing A when using hydro engine)
- Pin sealed by means of flat asbestos-free sealing
- Valve as a standard produced from carbon (P265GH or P355NL) or stainless (X6CrNiTi18-10) steel, the seat welded into the body
- Building length according to ČSN EN 558-1, series 14 (DIN 3202 – 1, series F4) – flanged type
- Protective coatings may be applied to the internal areas based on the customer requirements
- Marking in compliance with the EN standards

Testing

- Valves testing according to ČSN EN 12266-1

DATA SHEET K18

Application

• Automatic operation: Valve is equipped with a damper and the weight. Damper ensures continuous movement at automated closing upon back flow of the medium and it prevents uncontrolled impact at disc fitting closely in the fitting seat. Delivery with adjustable damper where the speed of the fitting closing can be regulated is possible upon request.

• Automatic operation with the option of closing using electric actuator: Weight together with the damper ensuring automated closing with damping at the medium back-flow are situated on the lever on the shaft from one side; on the other side there is an electric actuator with a clutch and a gear box placed. Electric actuator ensures valve opening or closing or adjusting in the arbitrary position any time when following the request for the regulation function.

• Automatic operation with the option of controlling the function by hydroactuator: The same as in the previous case when the valve is equipped with the weight but instead of the damper there is a linear hydro-cylinder installed allowing continuous opening, closing and gross

regulation of the flow. Delivery may also include a hydraulic pump with the control panel with the possibility to integrate the functions based on the customer requirements – e.g. multi-level closing, definition of the function in case of power supply disconnection, position transmitter, terminal switches etc.

Advantages

- Due to passive control force of the weight on the lever, the fitting may be closed at loss of pressure up to 2,5 bars
- Possibility of two-phase closing (slow fitting closely to the seat) – in case of hydroactuator control fully adjustable period of both phase duration
- Function of the back fitting (including two-phase proper closing) is maintained also in case of electricity supply disconnection
- Possibility of adjustment for building lengths according to the customer request
- Connection according to EN 1092-1 (after agreement also another GOST standard)

Operating data

Type K18
DN 300 - 1800
PN 6 - 25

**Check Valve Combined
with double eccentricity**

Flanged

DATA SHEET K18

Application

- Special industrial valve fulfilling the function of the check valve
- **Combined closure** – valve may fulfil the function of the check valve with the possibility of rough regulation of the fluid flow

• Fluids

Water (waste, service, drinking), air, steam, oils, crude oil and oil products, natural gas, coke oven and stack gas, other non-aggressive fluids and gases

• Industry

Conventional power, nuclear power, water supply industry, chemical industry, petrochemical industry, pulp and paper industry, geothermal sources

Connection

- Valve supplied in flanged type as a standard (flanges welded to the body) according to EN1092-1
- Other type on customers request

Installation

- Valves shall be installed in the horizontal piping in order to arrow on the body can correspond with the direction of the medium flow
- Valve disc rotation axis is situated in the horizontal position

Technical description

- Valve with double eccentricity
- Axis of the control shaft outside the sealing – seat axis; this solution enables sufficient sealing of the entire disc
- Closing disc eccentrically laid in the body and fastened on the control shaft and pin bedded in a rotary way in self-lubricated friction bearings
- Shaft sealed by means of "O" rings
- Soft-fitted valve – with EPDM, NBR or FPM sealing element
- Guaranteed sealing B according to EN 12266-1 in the direction of back flow to the pump (guaranteed sealing A when using hydro engine)
- Pin sealed by means of flat asbestos-free sealing
- Valve as a standard produced from carbon (P265GH or P355NL) or stainless (X6CrNiTi18-10) steel, the seat welded into the body
- Building length according to ČSN EN 558-1, series 14 (DIN 3202 – 1, series F4) – flanged type
- Protective coatings may be applied to the internal areas based on the customer requirements
- Marking in compliance with the EN standards

Testing

- Valves testing according to ČSN EN 12266-1

DATA SHEET K18

Application

• Automatic operation: Valve is equipped with a damper and the weight. Damper ensures continuous movement at automated closing upon back flow of the medium and it prevents uncontrolled impact at disc fitting closely in the fitting seat. Delivery with adjustable damper where the speed of the fitting closing can be regulated is possible upon request.

• Automatic operation with the option of closing using electric actuator: Weight together with the damper ensuring automated closing with damping at the medium back-flow are situated on the lever on the shaft from one side; on the other side there is an electric actuator with a clutch and a gear box placed. Electric actuator ensures valve opening or closing or adjusting in the arbitrary position any time when following the request for the regulation function.

• Automatic operation with the option of controlling the function by hydroactuator: The same as in the previous case when the valve is equipped with the weight but instead of the damper there is a linear hydro-cylinder installed allowing continuous opening, closing and gross

regulation of the flow. Delivery may also include a hydraulic pump with the control panel with the possibility to integrate the functions based on the customer requirements – e.g. multi-level closing, definition of the function in case of power supply disconnection, position transmitter, terminal switches etc.

Advantages

- Due to passive control force of the weight on the lever, the fitting may be closed at loss of pressure up to 2,5 bars
- Possibility of two-phase closing (slow fitting closely to the seat) – in case of hydroactuator control fully adjustable period of both phase duration
- Function of the back fitting (including two-phase proper closing) is maintained also in case of electricity supply disconnection
- Possibility of adjustment for building lengths according to the customer request
- Connection according to EN 1092-1 (after agreement also another GOST standard)

Multistage Control Valve

Butt-Welded

DATA SHEET K81

Application

- Regulating valves reducing pressure drop for fluids (i.e. the pressure difference at the inlet and outlet side) in the range of 5.1 to 20 MPa, for vapor and gas expansion ratio (i.e. the ratio of the outlet pressure to the inlet pressure) in the range of 0.7 to 0.2

• Industry

Power engineering, chemical facilities

• Environment

Normal, tropical, explosive, seismic

Technical description

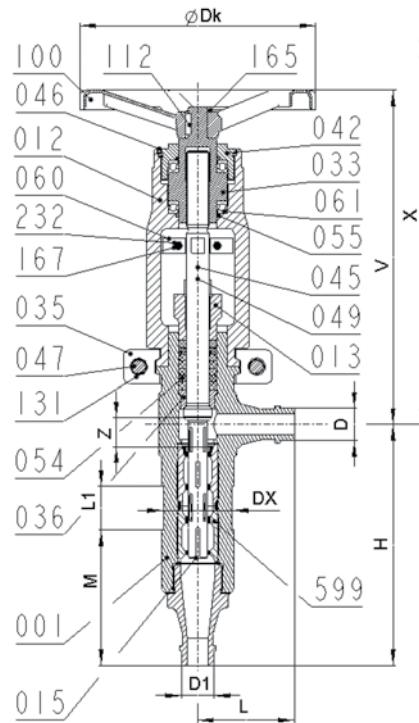

- Angle valve
- Forged body
- Gland valve

Operation

- Manual
- Electric servomotor

Connection

- Butt-welded

Valves with manual control

Butt-Welded

DATA SHEET K89

Application

- Protection of the central cavity of the valve against overpressure

• Fluids

Water, steam and non-aggressive working fluids

• Industry

Power plants, chemical and industry appliances

Technical description

- Body made of stainless steel
- Protected by bursting disc
- Blow off by the part with disc springs

Accessories

- Condensing pipe
- Shut-off valve with the locking device
- Coupling components with seal
- Bursted disc indicator

Connection

- Butt-welded according to ČSN EN 12627, ČSN 131075, DIN 2559
- Other upon request

Operating and maintenance

- AK 9908.89 – Technical description and instructions to operating, maintenance and repair of the relief valve

Operating data

- Seals up to 1,1 operating pressure P_p, blows off at 1,3 P_p

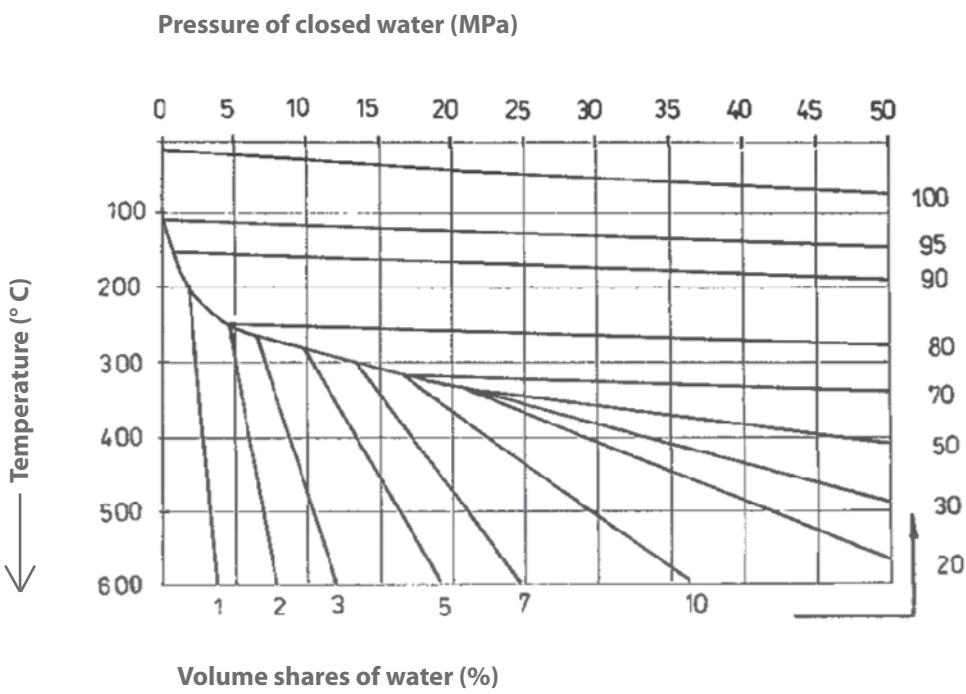

Operation

- Self-acting

DATA SHEET K89

Advantages of construction

- A** **Bursting device:**
Reliable valve protection against overpressure
- B** **Closing seat of the blow off part:**
Blow-off and closing of the flow after bursting of the bursting disc
- C** **Disc springs:**
Ensure closing
- D** **Drain:**
Safe removal of the working fluid
- E** **Bursting signalization:**
Information for operating staff and control centre
- F** **Globe valve with locking device:**
Prevents manipulation during operation, closes during changing of bursting disc
- G** **Condensing pipe:**
Lowers temperature of medium, allows position outside the isolation of the valve
